

Pymaceutical Observations

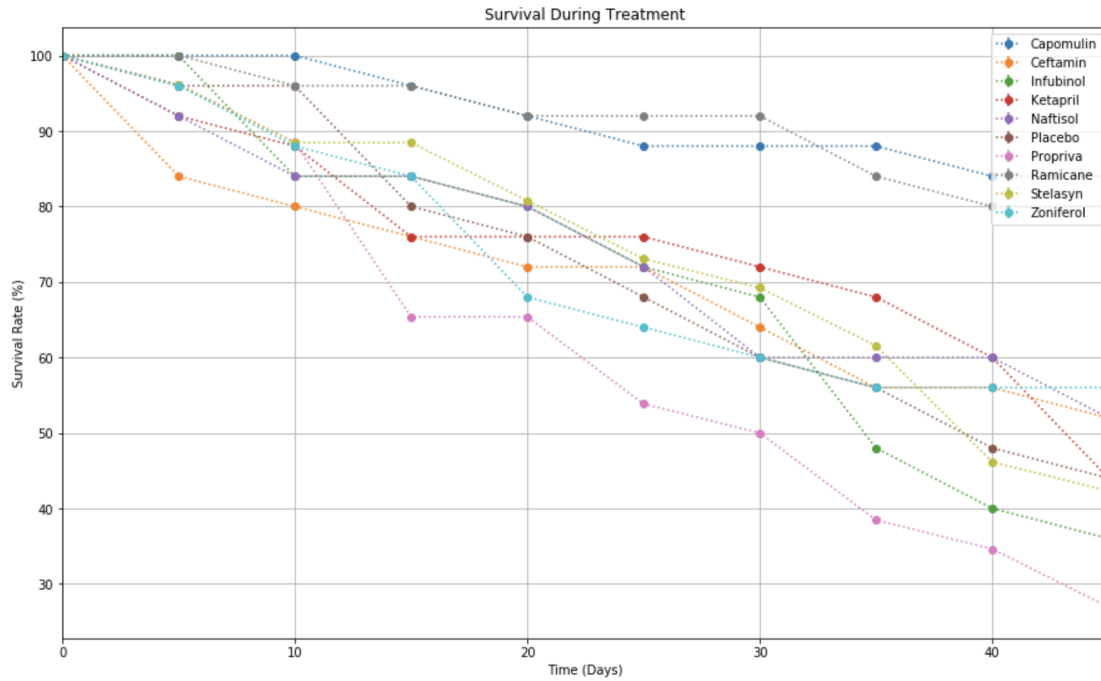

Observation # 1

Out of a study of 9 drugs and a placebo. The only drugs effective in reducing Tumor Volume were Capomulin and Ramicane, which, over a period of 45 days, saw a Tumor Volume reduction by roughly 10 mm³.

Observation # 2

Metastatic Sites spread for all mice in the study, regardless of Drug Treatment. However, mice which were being administered Capomulin or Ramicane saw a slower rate of spread.

Observation # 3

The study, which took place over a time period of 45 days, and consisting of 896 mice, yielded the following results. The drug, Propriva, had the lowest survival rate at just 27%. Capomulin had the highest survival rate at 84%, followed closely by Ramicane at 80%.
